

TIRZEPATIDE (MOUNJARO) INFORMATION DOCUMENT

WHAT IS TIRZEPATIDE, ANYWAY?

Tirzepatide is a next-generation injectable peptide that activates two gut hormone receptors at once: GLP-1 (like semaglutide) and GIP (glucose-dependent insulinotropic polypeptide). This dual action gives it powerful effects on blood sugar control and weight loss. It is not the same active ingredient as semaglutide; tirzepatide is a different molecule with a broader metabolic effect and often even greater weight-loss outcomes in studies. At mobivive, tirzepatide is supplied as a prefilled cartridge pen, similar to our semaglutide pens, with multi-dose capacity so you can self-inject once per week at home.

INTRODUCING TIRZEPATIDE AT mobivive

If you're looking for an advanced option for weight loss and metabolic health, tirzepatide offers dual-pathway action in a simple once-weekly pen. mobivive integrates tirzepatide with tailored IV therapies and lifestyle guidance to help tackle stubborn weight, insulin resistance, and metabolic syndrome.

THE SCIENCE

Tirzepatide mimics both GLP-1 and GIP:

- GLP-1 action reduces appetite, slows gastric emptying, and improves post-meal insulin release
- GIP action further enhances insulin responsiveness, supports fat metabolism, and may help preserve lean muscle during weight loss

Together this leads to strong appetite control, lower blood sugar, improved insulin sensitivity, and large, sustained reductions in body weight when combined with nutrition and activity changes.

THE TIRZEPATIDE PROCESS AT mobivive

1. Complete your medical questionnaire and once-off doctor consultation

As a GLP-1 medication, tirzepatide requires a once-off doctor consultation (R500) for all new clients before your script can be generated and your order placed. This applies regardless of your medical questionnaire answers and is a standard requirement for all GLP-1 prescriptions at mobivive. If you answer "Yes" to any medical questionnaire question, additional review may be required before proceeding.

2. Script and order

Once your consultation and script are approved, we dispense your tirzepatide in a prefilled cartridge style pen—no vials or loose needles. Your dose and titration schedule (how and when to increase dose) will be clearly indicated on your script and client information sheet.

3. Weekly pen routine

You inject once weekly, on the same day each week. Using the pen is straightforward: attach the pen needle, dial the prescribed dose, press the pen against your abdomen, thigh or upper arm, and hold for the click. Dose is increased gradually according to your protocol and tolerance.

KEY REMINDERS

- Tirzepatide is a different active ingredient from semaglutide, but is used for similar goals (weight loss and metabolic control)
- A once-off doctor consultation (R500) is required for all new GLP-1 clients before your first order
- Inject once a week, same day each week
- Rotate injection sites between abdomen, thigh, and upper arm
- All tirzepatide supplied by mobivive is in prefilled cartridge pens – no vials, no manual reconstitution, no separate syringes
- Keep pens refrigerated and remove a few minutes before injection for comfort
- Combine with balanced nutrition, hydration, and regular activity for best results

HOW MUCH DOES IT COST

Tirzepatide 5mg Prefilled Pen (2.4ml): R3,199 (4 weeks supply)

Tirzepatide 10mg Prefilled Pen (2.4ml): R4,999 (8 weeks supply)

(Includes medical questionnaire review and script generation; once-off R500 doctor consultation required for all new GLP-1 clients)

THE TIRZEPATIDE METABOLIC PROGRAM

For maximum benefit, you can combine your weekly tirzepatide pen with our Weight Loss or Longevity IV protocols. This coordinated approach targets appetite, blood sugar, inflammation, gut health, and energy simultaneously, giving you a structured pathway to long-term metabolic transformation and weight control.

LET'S TALK SIDE EFFECTS

Side effects are similar to other GLP-1-based therapies and may include nausea, diarrhoea, constipation, abdominal discomfort, or decreased appetite, usually most noticeable in the first weeks or when the dose is increased. Gradual dose titration, smaller meals, slower eating, and staying hydrated reduce these. More serious risks (pancreatitis, gallbladder issues, thyroid disease history, etc.) are screened via your medical questionnaire and your once-off doctor consultation before starting therapy.

BOOKING YOUR TREATMENT / ORDER YOUR PEPTIDE

Keen to explore tirzepatide as your next-level weight-loss and metabolic solution? Whether you want more info, need help with the questionnaire, or are ready to order your peptide, contact us:

- Email: orders@mobivive.co.za
- WhatsApp: 064-512-8018
- Call: 061-509-6038

And remember: every peptide we offer at mobivive including tirzepatide is supplied as a prefilled cartridge style pen for maximum ease, safety, and convenience.
